# What is SPI?

---

The quality of the software system is governed by the quality of the process used to develop and maintain it.

Good SE =| Good Development -| Good product

Software Process Improvement (SPI) involves understanding existing processes and introducing process changes to improve product quality, reduce costs or accelerate schedules

The SPI strategy transforms the existing approach to software development into something that is **more focused, more repeatable** and **more reliable**

# What is SPI?...

---

Most process improvement work so far has focused on defect reduction.

This reflects the increasing attention paid by industry to quality.

However, other process attributes can also be the focus of improvement

## **These attributes are**

**Understandability** - To what extent is the process explicitly defined and how easy is it to understand the process definition?

**Visibility** - Do the process activities culminate in clear results so that the progress of the process is externally visible?

**Supportability** - To what extent can CASE

# What is SPI?...

---

## These attributes are ...

**Acceptability** - Is the defined process acceptable to and usable by the engineers responsible for producing the software product?

**Reliability** - Is the process designed in such a way that process errors are avoided or trapped before they result in product errors?

**Robustness** - Can the process continue in spite of unexpected problems?

**Maintainability** - Can the process evolve to reflect changing organisational requirements or identified process improvements?

**Rapidity** - How fast can the process of

# What is SPI?...

---

SPI implies that

elements of an effective software process can be defined in an effective manner

an existing organizational approach to software development can be assessed against those elements, and

a meaningful strategy for improvement can be defined.

The effort and time that is required to implement an SPI strategy must pay for itself in some measurable way.

That is, SPI Strategy must reduce

the **number of defects** that are delivered to end users,

the **amount of rework** due to quality problems,

# Approaches for SPI

---

Informal approach to SPI can be chosen, but the vast majority choose one of a number of SPI frameworks

An *SPI framework* defines

a **set of characteristics** that must be present if an effective software process is to be achieved

a **method for assessing** whether those characteristics are present

a **mechanism for summarizing the results** of any assessment, and

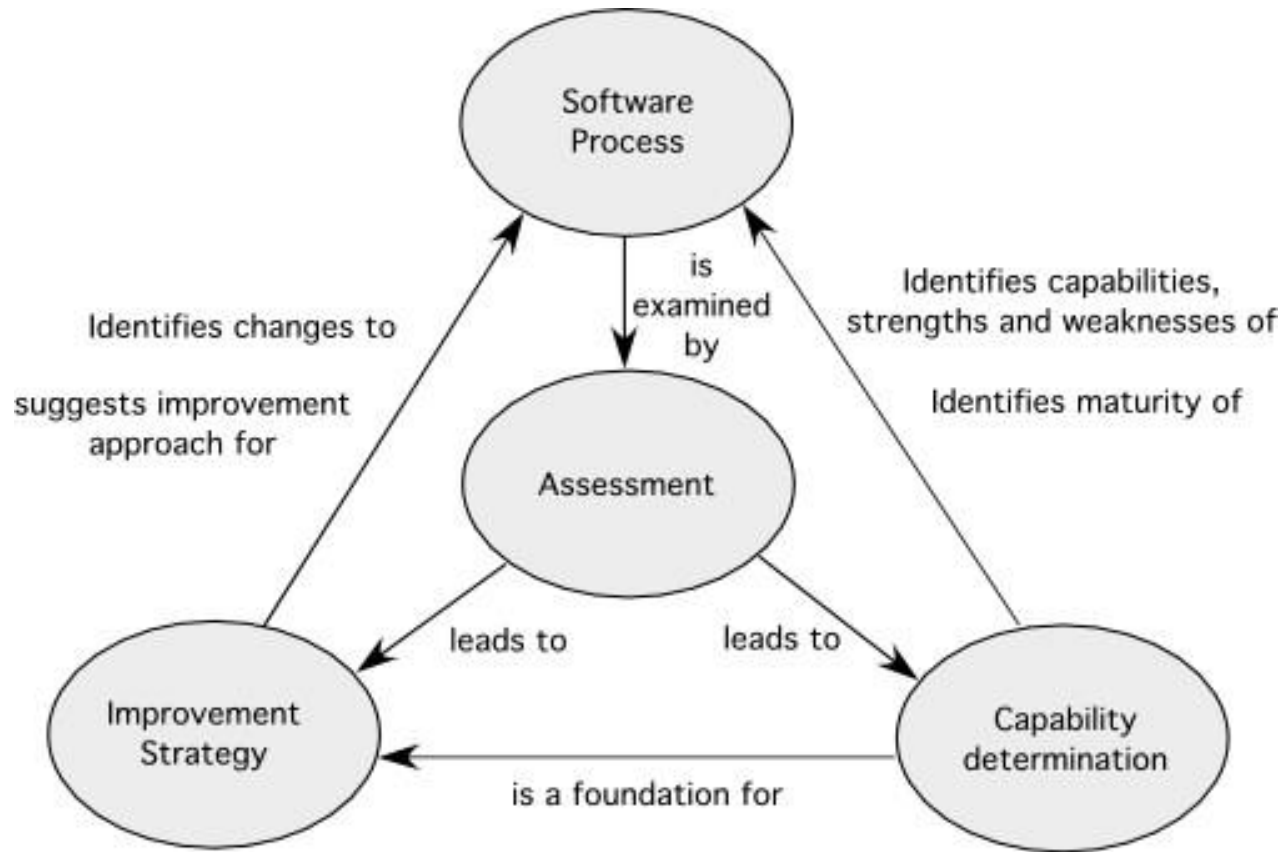

a **strategy for assisting** a software organization in implementing those process characteristics that have been found to be weak or missing.

SPI framework assesses the “maturity” of an

# Approaches for SPI...

---

## Elements of a SPI Framework

# Maturity Models

---

A **maturity model** is applied within the context of an SPI framework.

The intent of the maturity model is to provide an overall indication of the “process maturity” exhibited by a software organization.

an indication of the quality of the software process, the degree to which practitioner’s understand and apply the process, and the general state of software engineering practice.

This is accomplished using some type of ordinal scale.

SW-CMM and ISO9001

Other standards help with process assessment, capability determination, and process improvement are

# Is SPI for Everyone?

---

For many years, SPI was viewed as a “corporate” activity

But, can a small company initiate SPI activities and do it successfully?

Answer: a qualified “yes”

It should come as no surprise that small organizations are more informal, apply fewer standard practices, and tend to be self-organizing.

SPI will be approved and implemented only after its proponents demonstrate *financial leverage*.

That is you must show a realistic return on investment for SPI costs

# Benefits of SPI ?

---

## Benefits of SPI

Improvements to quality

Reductions in the cost of poor quality

Improvements in productivity

Reductions to the cost of software development

Improvements to on-time delivery

Improved consistency in budget and schedule delivery

Improvements to customer satisfaction

Improvements to employee morale

# SPI Process

---

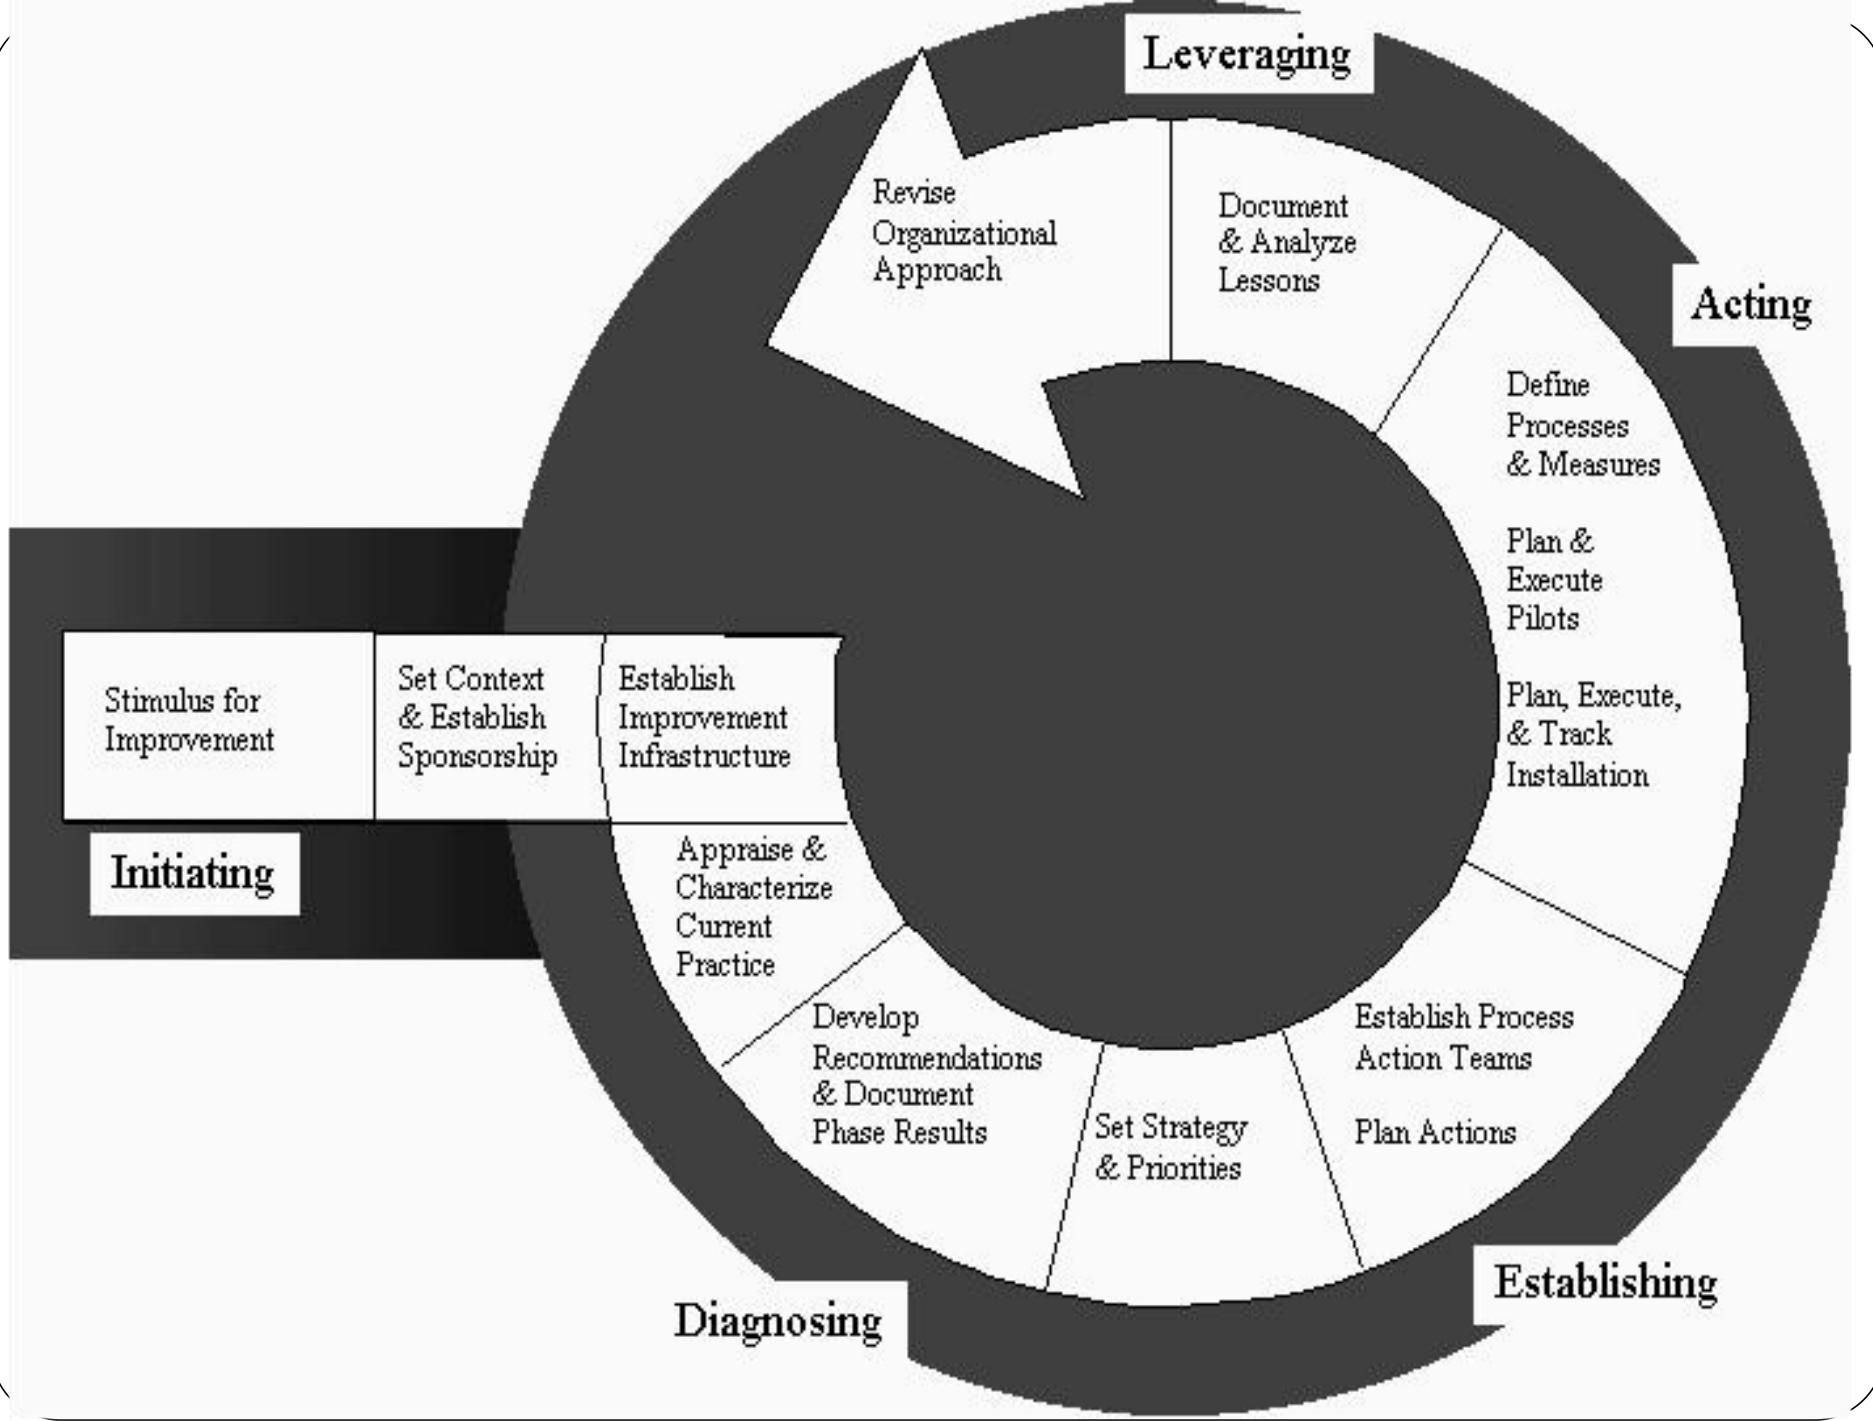

Establishing a consensus for initiating SPI and defining an ongoing strategy for implementing it across a software organization is a very difficult process.

To alleviate the problem SEI has defined SPI Implementation Model called **IDEAL**

It is an organizational improvement model that serves as a roadmap for initiating, planning, and implementing improvement actions

Depicts activities of a process improvement programme and presents a consistent view of what is involved in transitioning the CMM into an organization's practice.

The five distinct activities that guide an

# SPI Process...

---

In this lecture we will see in detail somewhat different road map for SPI

It applies a commonsense philosophy that requires an organization to

1. look in the mirror,
2. then get smarter so it can make intelligent choices,
3. select the process model (and related technology elements) that best meets its needs,
4. instantiate the model into its operating environment and its culture, and
5. evaluate what has been done.

These five activities are applied in an iterative (cyclical) manner in an effort to

# Gap Analysis

---

Assessment examines a wide range of actions and tasks that will lead to a high quality process.

**Consistency.** Are important activities, actions and tasks applied consistently across all software projects and by all software teams?

**Sophistication.** Are management and technical actions performed with a level of sophistication that implies a thorough understanding of best practice?

**Acceptance.** Is the software process and software engineering practice widely accepted by management and technical staff?

**Commitment.** Has management committed the resources required to achieve consistency, sophistication and acceptance?

*Gap analysis*—The difference between local

# Training

---

Three types of education and training should be conducted:

**Generic concepts and methods.** Directed toward both managers and practitioners, this category stresses both process and practice. The intent is to provide professionals with the intellectual tools they need to apply the software process effectively and to make rational decisions about improvements to the process.

**Specific technology and tools.** Directed primarily toward practitioners, this category stresses technologies and tools that have been adopted for local use. For example, if UML has been chosen for analysis and design modeling, a training curriculum for software engineering using UML would be established.

**Business communication and quality-related**

# Justification

---

Choose the process model that best fits your organization, its stakeholders, and the software that you build

Decide on the set of framework activities that will be applied, the major work products that will be produced and the quality assurance checkpoints that will enable your team to assess progress

Develop a work breakdown for each framework activity (e.g., modeling), defining the task set that would be applied for a typical project

Once a choice is made, time and money must be expended to install it within an

# Installation/Migration

---

*Installation* - Framework activities, software engineering actions, and individual work tasks must be defined and installed as part of a new software engineering culture.

*Migration* - changes associated with SPI are relatively minor, representing small, but meaningful modifications to an existing process model

*Software process redesign (SPR)* - concerned with identification, application, and refinement of new ways to dramatically improve and transform software processes.

Three different process models are considered:

the existing ("as is") process

# SPI Process: Evaluation

---

## Assesses

the degree to which changes have been instantiated and adopted,

the degree to which such changes result in better software quality or other tangible process benefits, and

the overall status of the process and the organizational culture as SPI activities proceed

From a qualitative point of view, past management and practitioner attitudes about the software process can be compared to

# Risk Management for SPI

---

Manage risk at three key points in the SPI process

prior to the initiation of the SPI roadmap,  
during the execution of SPI activities (assessment, education, selection, installation), and  
during the evaluation activity that follows the instantiation of some process characteristic.

In general, the following categories can be identified for SPI risk factors:

- |                           |                      |
|---------------------------|----------------------|
| budget and cost           | process stakeholders |
| content and deliverables  | schedule for SPI     |
| development               | development          |
| environment and           | SPI development      |
| mission and goals         | environment and      |
| organizational management | process              |
| organizational stability  | SPI project          |
|                           | management and SPI   |
|                           | staff                |

# Risk Critical Success Factors

---

SPI is a risky endeavor and that the failure rate for companies that try to improve their process is distressingly high.

Organizational risks, people risks, and project management risks are present challenges for those who lead any SPI effort.

Although risk management is important, it's equally important to recognize those critical factors that lead to success.

The top five Critical Success Factors are

- Management commitment and support

- Staff involvement

- Process integration and understanding

# Model(CMM)

---

Developed by the Software Engineering Institute (SEI) of the Carnegie Mellon University

Framework that describes the key elements of an effective software process.

Describes an evolutionary improvement path for software organizations from an ad hoc, immature process to a mature, disciplined one.

Provides guidance on how to gain control of processes for developing and maintaining

# CMM...

---

## **Matured Organizations**

Processes are defined, documented and controlled

Roles and responsibilities are clear

Products and processes are measured

Quality, costs and schedules are measured and followed-up

Management is committed to continuous improvement

Technology is effectively used within organisation's SW process(es)

Preventive quality work is a fact

# CMM...

---

## Why CMM?

Increasing cost of software

Quality problems in software products

Cost of software maintenance

Governments put billions of dollars in software acquisition

Countries competitiveness increasingly dependent on software

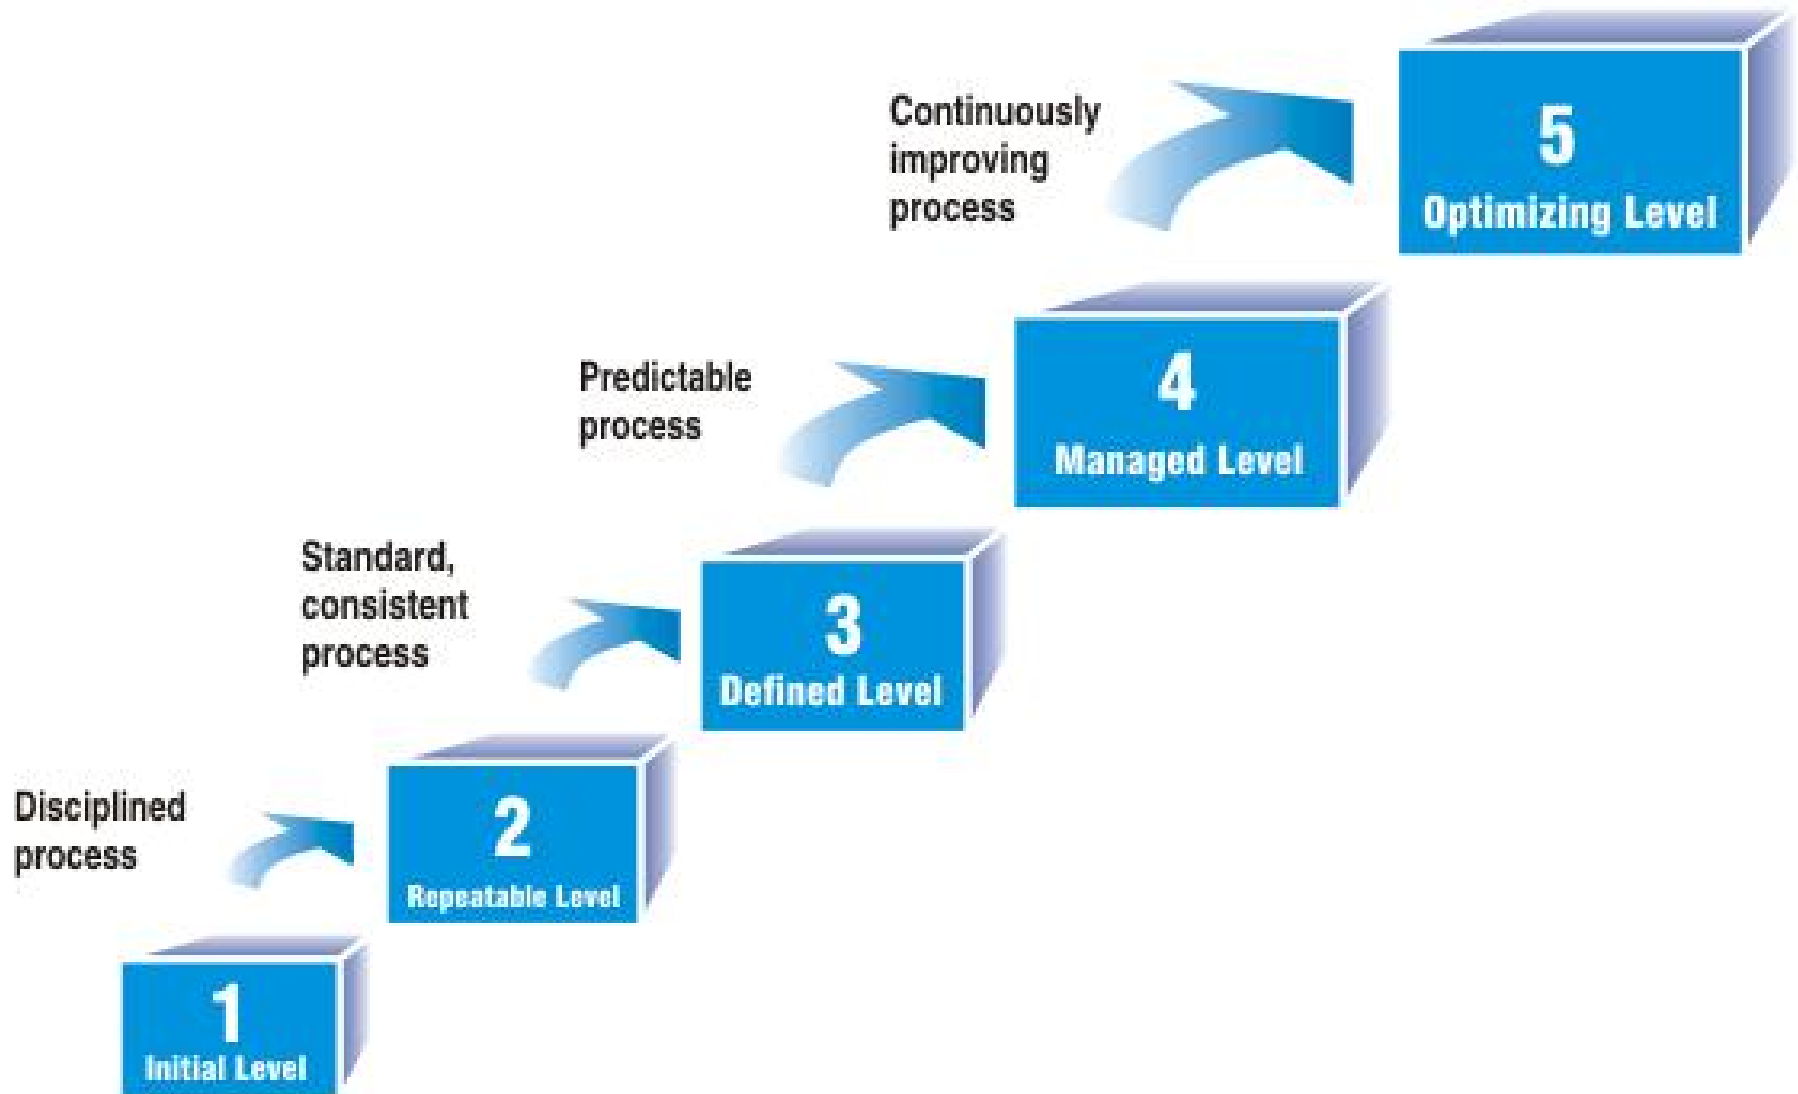

Increasing rate of change in technology and software environment

Typical software project was a year late and exceeded two times the budget

Increasing SW complexity

# CMM...

## Five Levels of CMM

# CMM Level 1: Initial

---

The software process is characterized as ad hoc, and occasionally even chaotic.

Few processes are defined, and success depends on **individual effort**.

At this level, frequently have difficulty making commitments that the staff can meet with an orderly process

Products developed are often over budget and schedule

Wide variations in cost, schedule, functionality and quality targets

Capability is a characteristic of the individuals, not of the organization

# CMM Level 2: Repeatable

---

Basic process management processes are established to track cost, schedule, and functionality.

The necessary process discipline is in place to repeat earlier successes on projects with similar applications.

- Realistic project commitments based on results observed on previous projects

- Software project standards are defined and faithfully followed

- Processes may differ between projects

- Process is disciplined

- earlier successes can be repeated

# CMM Level 3: Defined

---

The software process for both management and engineering activities is documented, standardized, and integrated into a standard software process for the organization.

All projects use an approved, tailored version of the organization's standard software process for developing and maintaining software.

Project and organisation level training plans are created and followed

More systematic technical coordination between different project groups

# CMM Level 4: Managed

---

Detailed measures of the software process and product quality are collected.

Both the software process and products are quantitatively understood and controlled.

Narrowing the variation in process performance to fall within acceptable quantitative bounds

When known limits are exceeded, corrective action can be taken

Quantifiable and predictable

predict trends in process and product quality

# CMM Level 5: Optimizing

---

Continuous process improvement is enabled by quantitative feedback from the process and from piloting innovative ideas and technologies.

Goal is to prevent the occurrence of defects

Causal analysis

Data on process effectiveness used for cost benefit analysis of new technologies and proposed process changes

The causes of defects are eliminated as part of preventive quality work

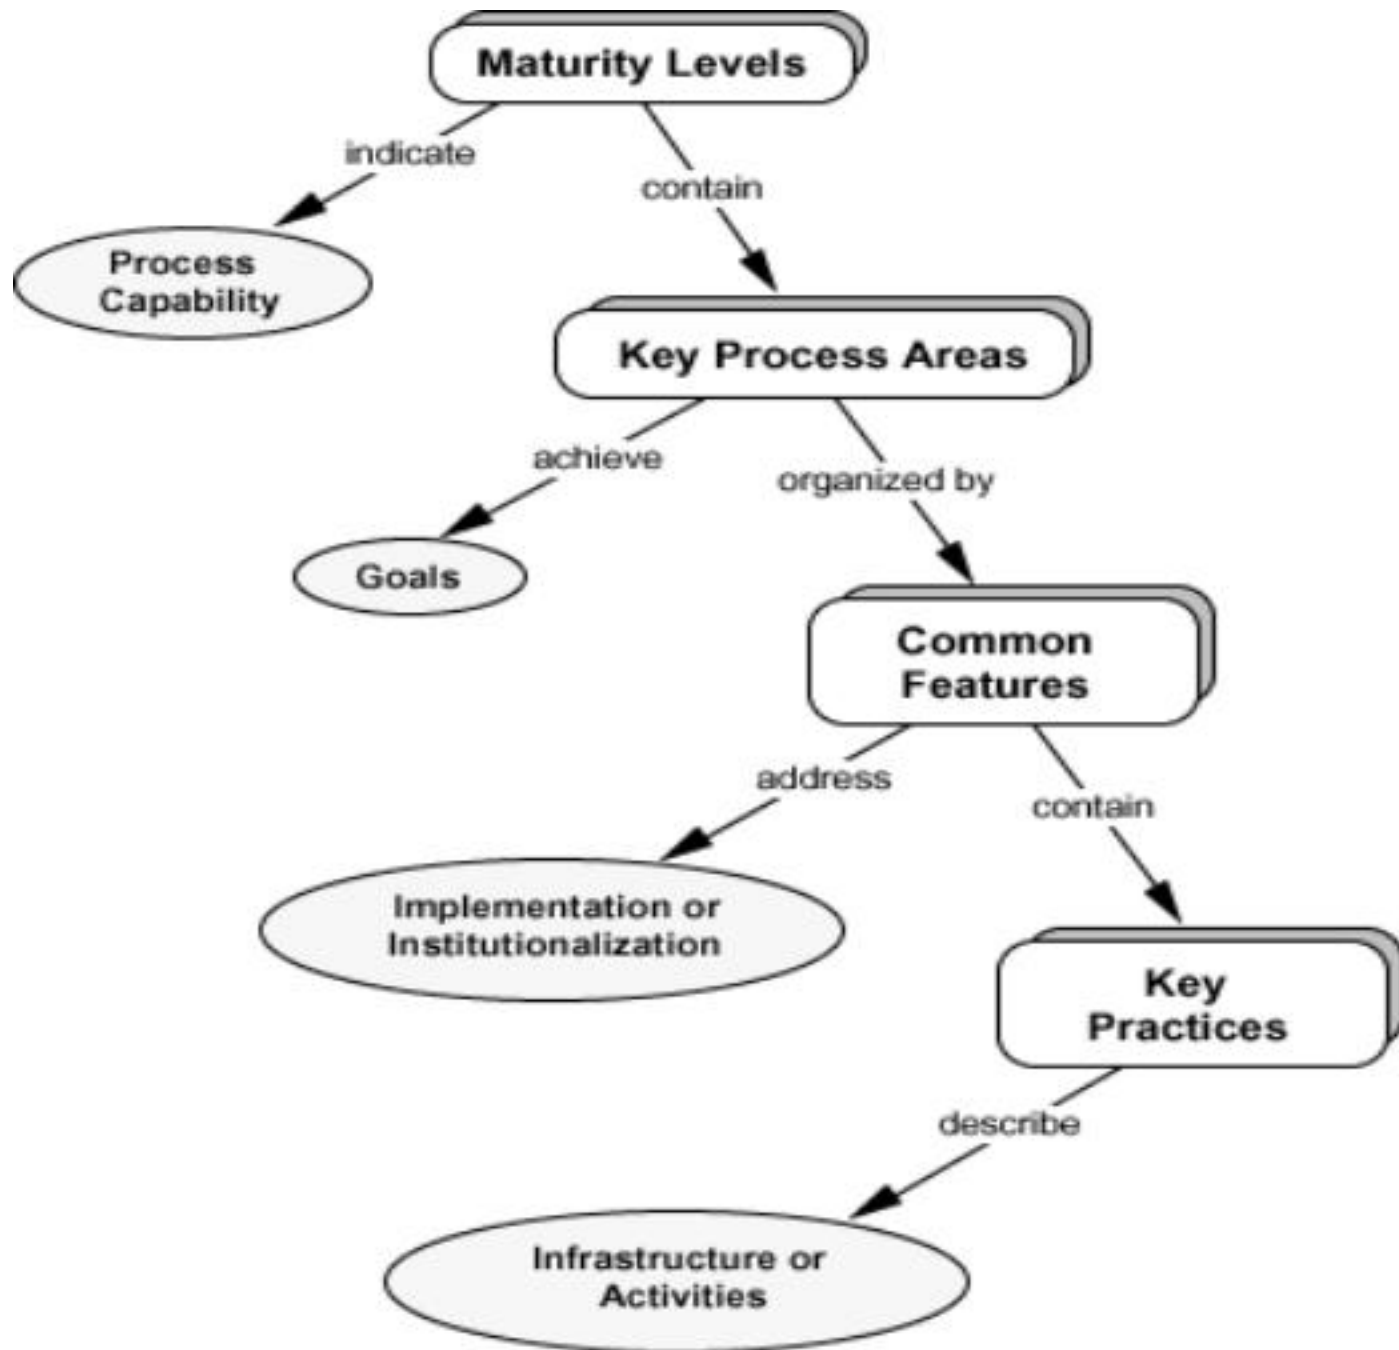

New technologies can be utilised effectively to improve process capability

# Levels

---

Except for level 1, each level is decomposed into key process areas (KPA)

Each KPA identifies a cluster of related activities that, when performed collectively, achieve a set of goals considered important for enhancing software capability.

# Level 2 KPAs

---

## Requirements Management

Establish common understanding of customer requirements between the customer and the software project

Requirements is basis for planning and managing the software project

Not working backwards from a given release date!

## Software Project Planning

Establish reasonable plans for performing the software engineering activities and for managing the software project

## Software Project Tracking and Oversight

Establish adequate visibility into actual progress

Take effective actions when project's performance deviates significantly from planned

# Level 2 KPAs...

---

Software Subcontract Management

Manage projects outsourced to subcontractors

Software Quality Assurance

Provide management with appropriate visibility into

process being used by the software projects work products

Software Configuration Management

Establish and maintain the integrity of work products

Product baseline

Baseline authority

# Level 3 KPAs

---

## Organization Process Focus

Establish organizational responsibility for software process activities that improve the organization's overall software process capability

## Organization Process Definition

Develop and maintain a usable set of software process assets

stable foundation that can be institutionalized  
basis for defining meaningful data for  
quantitative process management

## Training Program

Develop skills and knowledge so that individual can perform their roles effectively and efficiently

Organizational responsibility

Needs identified by project

# Level 3 KPAs...

---

## Integrated Software Management

Integrated engineering and management activities  
Engineering and management processes are tailored from the organizational standard processes  
Tailoring based on business environment and project needs

## Software Product Engineering

technical activities of the project are well defined (SDLC)  
correct, consistent work products

## Intergroup Coordination

Software engineering groups participate actively with other groups

## Peer Reviews

early defect detection and removal  
better understanding of the products

# Level 4 KPAs

---

## Quantitative Process Management

control process performance quantitatively  
actual results from following a software

process

focus on identifying and correcting special  
causes of variation with respect to a  
baseline process

## Software Quality Management

quantitative understanding of software

quality

products

process

# Level 5 KPAs

---

## Process Change Management

continuous process improvement to improve quality, increase productivity, decrease cycle time

## Technology Change Management

identify and transfer beneficial new technologies

tools

methods

processes

## Defect Prevention

causal analysis of defects to prevent recurrence

# The People CMM

is a maturity framework that focuses on continuously improving the management and development of the human assets of an organization defines a set of five organizational maturity levels that provide an indication of the

Level	Focus	Process Areas
Optimized	<i>Continuous improvement</i>	Continuous workforce innovation Organizational performance alignment Continuous capability improvement
Predictable	<i>Quantifies and manages knowledge, skills and abilities</i>	Mentoring Organizational capability management Quantitative performance management Competency-based assets Empowered workgroups Competency integration
Defined	<i>Identifies and develops knowledge, skills and abilities</i>	Participatory culture Workgroup development Competency-based practices Career development Competency development Workforce planning Competency analysis
Managed	<i>Repeatable, basic people management practices</i>	Compensation Training and development Performance management Work environment Communication and coordination Staffing

# Other SPI Frameworks

---

## **Capability Maturity Integration(CMMI)**

is a process model that provides a clear definition of what an organization should do to promote behaviors that lead to improved performance.

It is successor of CMM

## **Software Process Improvement and Capability dEtermination(SPICE)—**

an international initiative to support the International Standard ISO/IEC 15504 for (Software) Process Assessment

# Other SPI Frameworks...

---

## **Bootstrap**

a SPI framework for small and medium sized organizations that conforms to SPICE

## **Team Software Process(TSP) & Personal Software Process (PSP)**

individual and team specific SPI frameworks that focus on process in-the-small, a more rigorous approach to software development coupled with measurement

## **TickIT**

an auditing method that assesses an organization compliance to ISO Standard

# SPI Return on Investment

---

“How do I know that we’ll achieve a reasonable return for the money we’re spending?”

$$ROI = [S (\textit{benefits}) - S (\textit{costs})] / S (\textit{costs}) \times 100\%$$

where

*ROI* return on Investment

*benefits* include the cost savings associated with higher product quality (fewer defects), less rework, reduced effort associated with changes, and the income that accrues from shorter time-to-market.

*costs* include both direct SPI costs (e.g., training, measurement) and indirect costs associated with greater emphasis on quality control and change

# SPI Trends

---

Future SPI frameworks must become significantly more agile

Rather than an organizational focus (that can take years to complete successfully), contemporary SPI efforts should focus on the project level

To achieve meaningful results (even at the project level) in a short time frame, complex framework models may give way to simpler models.

Rather than dozens of key practices and hundreds of supplementary practices, an agile SPI framework should emphasize only a
